Ideation Phase

Brainstorm & Idea Prioritization Template

Project Name: Smart Meet – Video Conferencing Application

Maximum Marks: 4 Marks

◈ Step-1: Team Gathering, Collaboration and Select the Problem Statement

👥 Team Discussion:

The team gathered to discuss real-world problems related to communication and collaboration. We analyzed current challenges faced in online meetings, especially in education and remote work environments.

Problem Statement:

Many existing video conferencing platforms are either:

- Expensive or require subscriptions
- Complex to use for beginners
- Lack integrated features like chat, recording, and scheduling in one place

🎯 Selected Problem:

To develop a user-friendly, cost-effective video conferencing application that enables seamless communication, collaboration, and meeting management.

◈ Step-2: Brainstorm, Idea Listing and Grouping

Brainstormed Ideas:

1. Basic video calling app
2. Chat-based communication platform
3. Video conferencing with screen sharing
4. Meeting scheduler with reminders
5. Recording feature for meetings
6. File sharing during meetings
7. AI-based meeting summary (advanced idea)
8. Secure login & authentication system
9. Multi-user video conferencing rooms

10. Real-time chat during meetings

🗁 Idea Grouping:

◆ Core Features:

- Video conferencing
- Audio/video controls
- Multi-user rooms

◆ Communication Features:

- Real-time chat
- Notifications

◆ Advanced Features:

- Screen sharing
- Recording
- Scheduling meetings

◆ Security Features:

- User authentication (Login/Register)
- JWT-based security

◈ Step-3: Idea Prioritization

📊 Prioritization Criteria:

- Feasibility (Can we build it?)
- Impact (Usefulness to users)
- Complexity (Time & effort required)

Final Selected Features:

☆ High Priority (Must Have):

- User Registration & Login
- Video conferencing (Agora RTC)
- Room creation & joining

- Real-time chat (Socket.io)

☆ Medium Priority:

- Screen sharing
- Meeting controls (mute/unmute, leave)

☆ Low Priority (Future Scope):

- Recording meetings
- Meeting scheduling
- AI-based features

🏁 Final Idea:

Smart Meet – A full-stack video conferencing web application built using MERN Stack, Socket.io, and Agora RTC, enabling real-time communication, video streaming, and collaboration.

✅ Conclusion:

Through brainstorming and prioritization, the team identified a practical and scalable solution. The selected idea balances innovation, feasibility, and real-world applicability, making it suitable for development within the given timeframe.

Define the Problem Statements

◈ Problem Statement (PS-1)

I am a student or remote worker
I'm trying to attend or conduct online meetings/classes
But I face issues like poor interface, lack of integrated features, and difficulty managing meetings
Because most platforms are either complex or require paid subscriptions
Which makes me feel frustrated, disconnected, and less productive

◈ Problem Statement (PS-2)

I am a team leader or meeting host
I'm trying to organize and manage virtual meetings efficiently
But I struggle with managing participants, communication, and collaboration tools in one place
Because existing solutions lack seamless integration of chat, video, and scheduling
Which makes me feel stressed and inefficient during meetings

Empathize & Discover

Empathy Map Canvas

User: Student / Remote Worker

Says:

- "I need a simple app for meetings"
- "I want everything in one place"
- "Joining meetings should be quick"

Thinks:

- "Why are these apps so complicated?"
- "I hope my meeting doesn't lag"
- "I need a reliable platform"

Sees:

- Many apps like Zoom, Google Meet
- Complex dashboards
- Paid features for basic needs

Hears:

- Friends complaining about meeting issues
- Teachers asking to join meetings on time
- Team members discussing technical problems

Pain Points:

- Difficult UI
- Poor connectivity experience
- Lack of integrated features (chat, video, scheduling)

- Security concerns

Gains:

- Easy-to-use interface
- All features in one platform
- Smooth video/audio communication
- Better collaboration experience

📊 Empathy Map Diagram

```
  -------------------------------
  |          THINKS            |
  |  - App should be simple     |
  |  - Needs reliability        |
  -------------------------------
          ↑
-----------------|-----------------
| SEES | HEARS |
| - Many apps | - Complaints |
- Complex UI - Instructions
          ↓
  -------------------------------
  |          SAYS              |
  |  - Easy meetings needed     |
  |  - One platform solution    |
  -------------------------------
          ↓
  -------------------------------
  |      PAINS / GAINS         |
  | Pain: Complex, costly       |
  | Gain: Simple, smooth app    |
  -------------------------------
```

Conclusion:

The empathy map helps us understand the user's needs, frustrations, and expectations. This insight allows us to design a user-friendly and efficient video conferencing application that solves real-world communication problems.
